

# phonegap

By John 2012/07/06

# Intro

- What's phonegap ?
- Getting start ( Android )
- Make your own plugin
- Supports
- Reference

# What is phonegap?

- An easier way to make mobile apps
- Build mobile using web-tech
- HTML for layout
- CSS and Image for rich look and feel
- Make your JavaScript do more

# What is phonegap?

- Phonegap's app

OS) 是在寫網頁嗎？  
OS) 好 low 啊  
OS) 拜托不要用這個

# What is phonegap?

OS) 好像有好一點點了  
OS) 這也是 phonegap ?

# What is phonegap?

Easymap 真是中心一大資產～好東西不繼續用真可惜～～

# What is phonegap?

A FPS Game !?

# What is phonegap?

HTML5 Game (OS : 看起來又不怎好玩 ~)

GAME LINK

# What is phonegap?

弄上手機了 !!!!!???

# What is phonegap?

How To ?

# So...HTML5 Angry Bird !?

- <http://chrome.angrybirds.com/>

# What is phonegap?

PhoneGap 宗旨: Write once , and deploy it to any mobile device

HomePage : <http://phonegap.com/>

Now Release : 1.9.0

License : Apache License V2.0

It will always remain **free** and **open source**  
under the Apache License.

Start Weight : 1~1.5MB (Android)

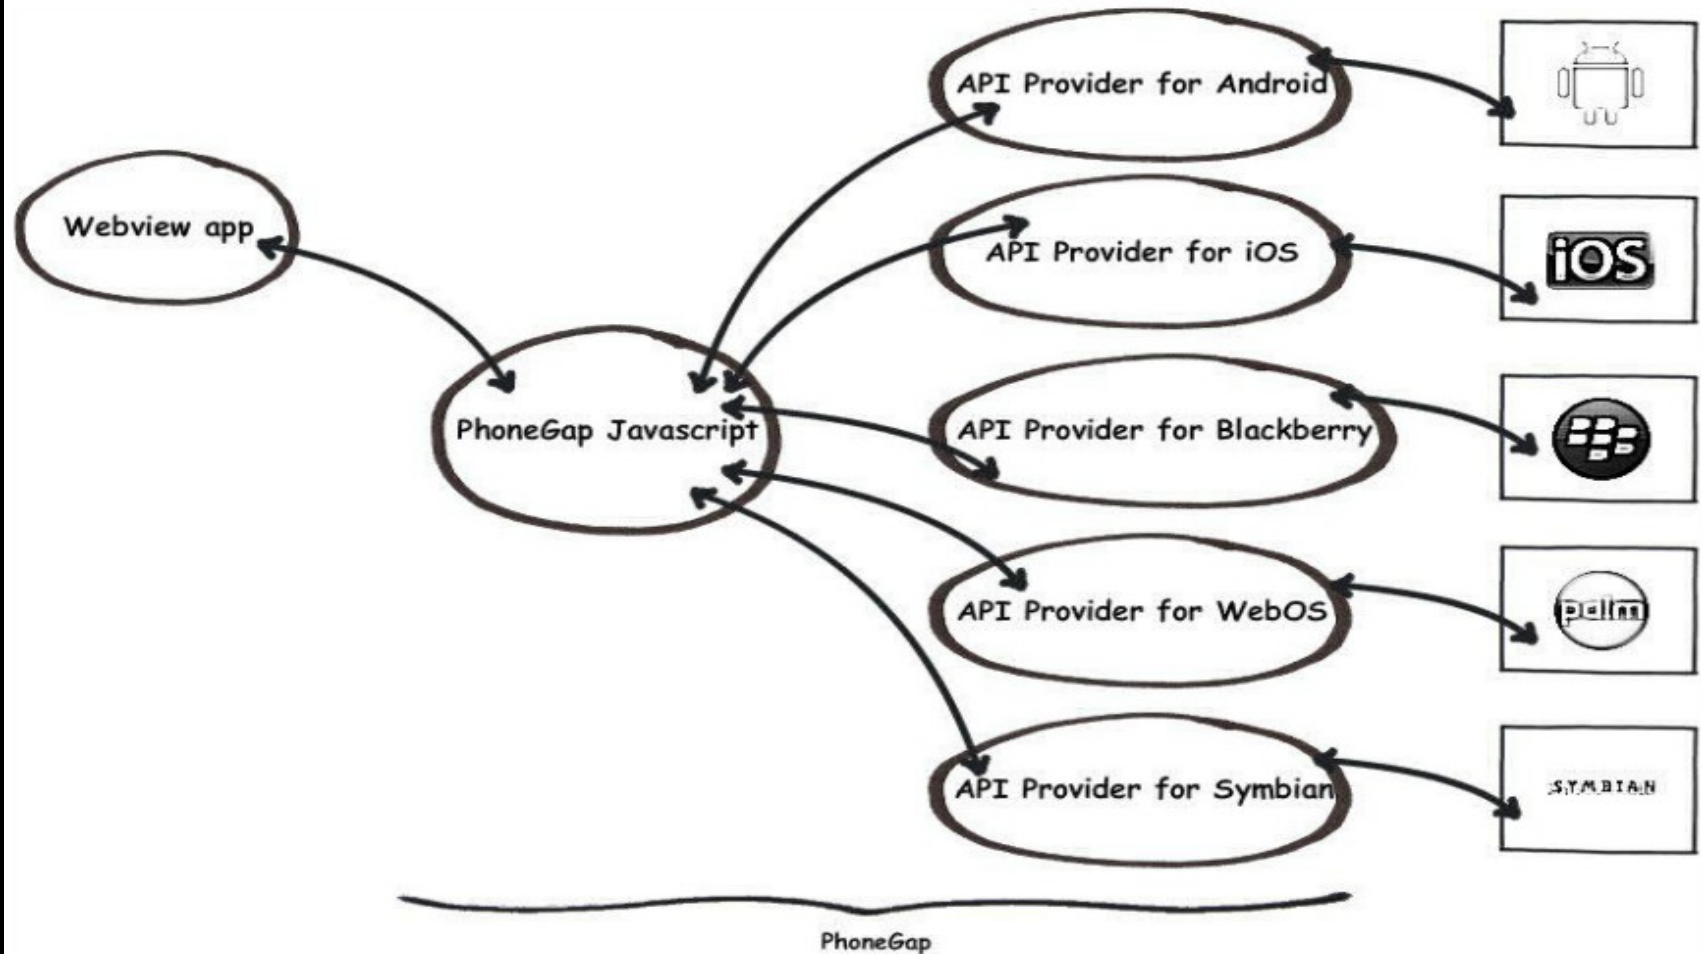

API Docs : <http://docs.phonegap.com/en/1.9.0/index.html>

PhoneGap is a standards-based, open-source development framework for building cross-platform mobile apps with HTML, CSS and JavaScript for iPhone/iPad, Google Android, Windows Phone 7, Palm, Symbian, BlackBerry and more.

Write a PhoneGap app once with HTML and Javascript and deploy it to any mobile device without losing features of a native app.

# What is phonegap?

## Concepts in PhoneGap

# Now Supports

	 iPhone / iPhone 3G	 iPhone 3GS and newer	 Android	 OS 5.x	 OS 6.0+	 WebOS	 WP7	 Symbian	 Bada
ACCELEROMETER									
CAMERA									
COMPASS									
CONTACTS									
FILE									
GEOLOCATION									
MEDIA									
NETWORK									
NOTIFICATION (ALERT)									
NOTIFICATION (SOUND)									
NOTIFICATION (VIBRATION)									
STORAGE									

# Getting Start (Android) -1

- 參考
- 編輯器: **Eclipse 3.4+**
  - 請平凡的建置 Android 的開發環境
  - (AVD、Android manager...)
- 新增或使用舊專案
  - 建立二個目錄
    - /libs
    - /assets/www
- **Download phonegap & unzip**
- **Copy cordova-1.9.0.js to assets/www**
- **Copy cordova-1.9.0.jar to /libs**
- **Copy xml to /res**

# Getting Start (Android) -2

- 調整 **AndroidManifest.xml**

```
<uses-permission android:name="android.permission.VIBRATE" />
<uses-permission android:name="android.permission.ACCESS_COARSE_LOCATION" />
<uses-permission android:name="android.permission.ACCESS_FINE_LOCATION" />
.....
```

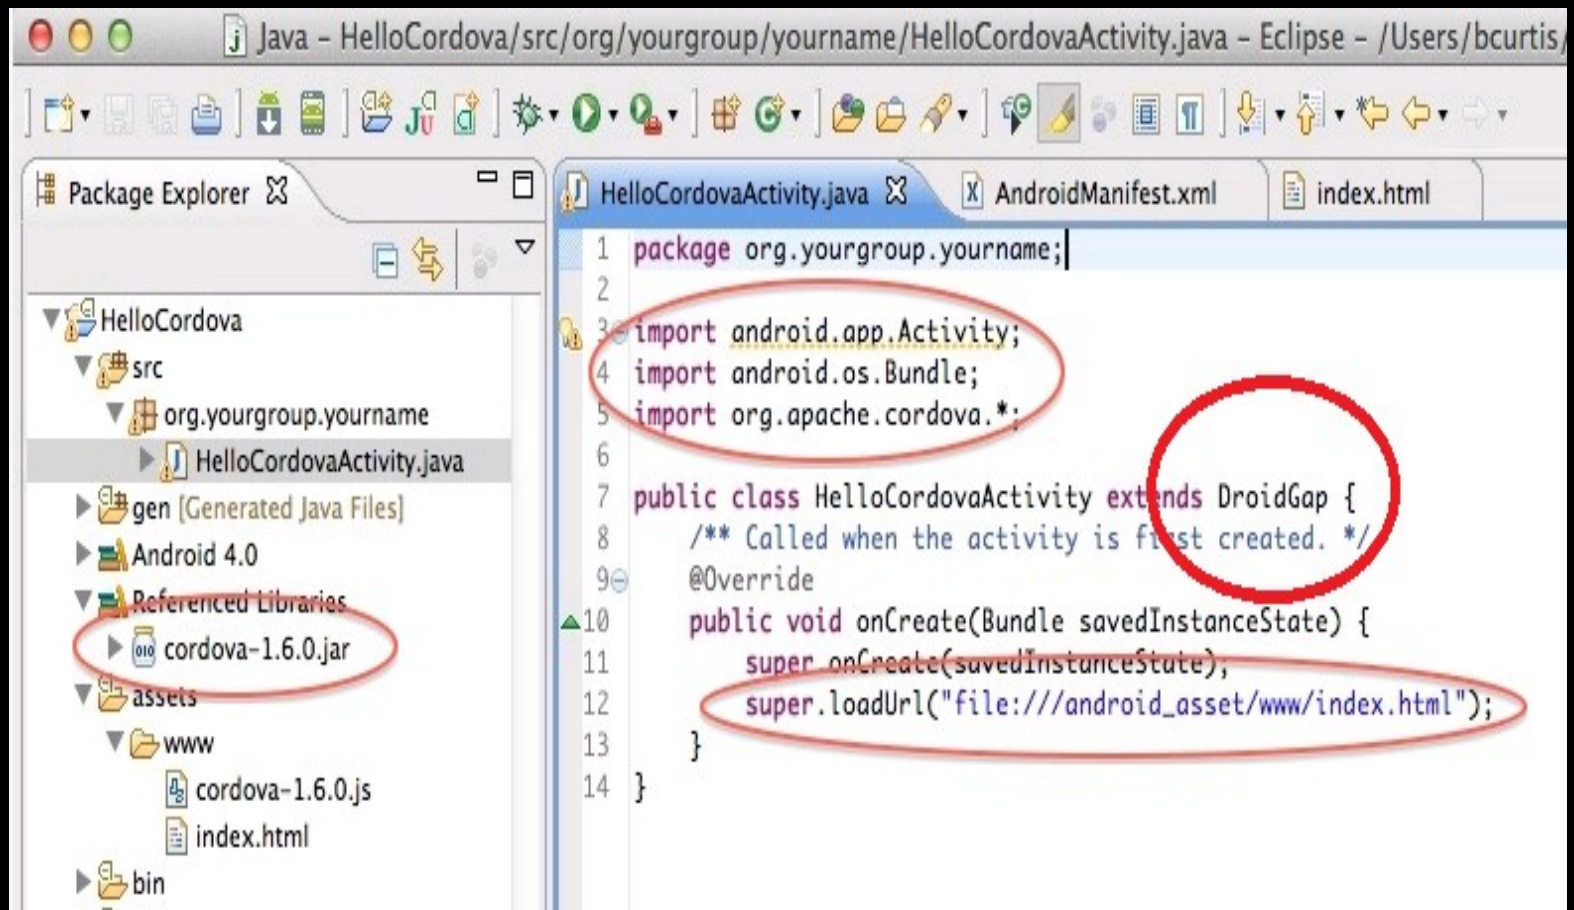

- 設定 **assets/www/index.html**

- <!DOCTYPE HTML>**

```
<html>
<head>
<title>Cordova</title>
<script type="text/javascript" charset="utf-8"
    src="cordova-1.9.0.js"></script>
</head>
<body>
<h1>Hello World, 世界你好</h1>
</body>
</html>
```

# Getting Start (Android) -3

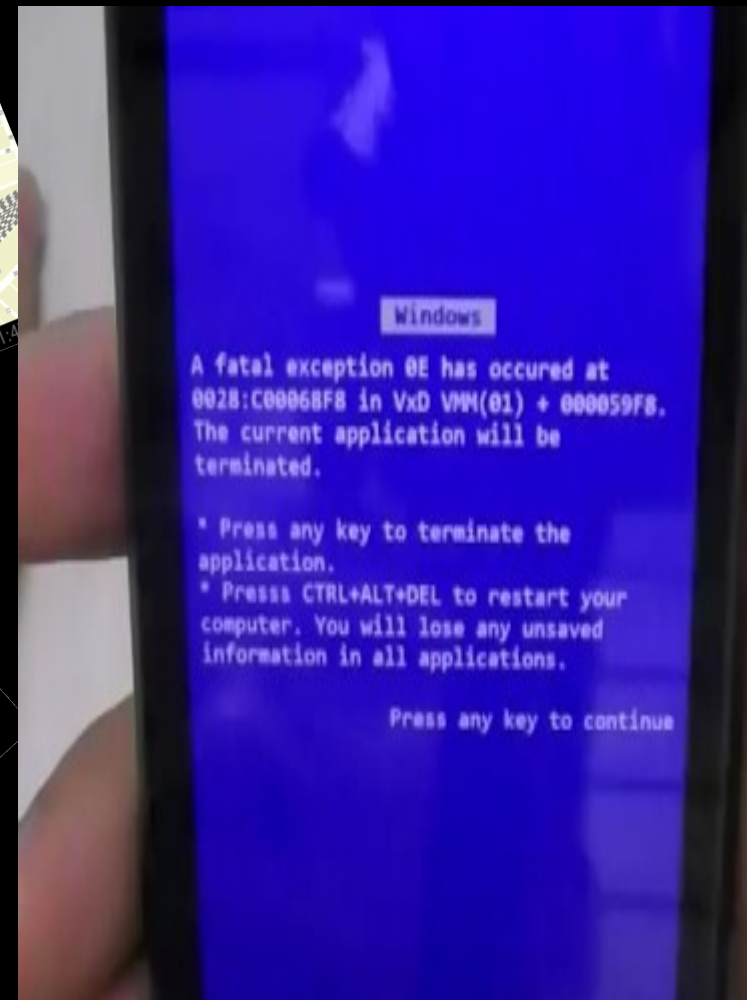

- **Java Build Path** 要指名加掛 **cordova**

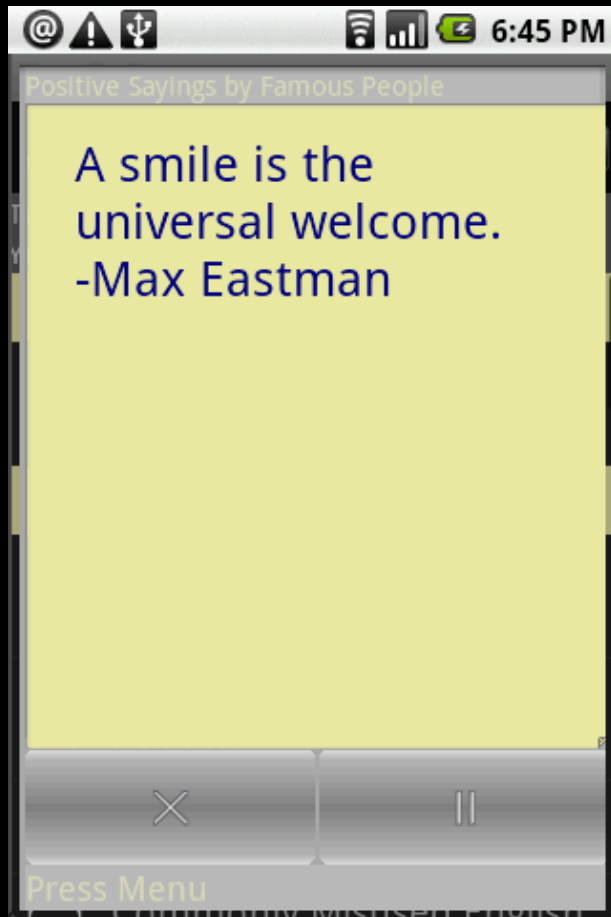

# 結果...

# 於是~~~~

# 創意與感受

# Docs

API Reference	
Accelerometer	<b>Accelerometer</b> Tap into the device's motion sensor.
Camera	<b>Camera</b> <b>Capture</b> a photo using the device's camera.
Capture	<b>Capture</b> media files using device's media capture applications.
Compass	<b>Compass</b> Obtain the direction that the device is pointing.
Connection	<b>Connection</b> Quickly check the network state, and cellular network information.
Contacts	<b>Contacts</b> Work with the devices contact database.
Device	<b>Device</b> Gather device specific information.
Events	<b>Events</b> Hook into native events through JavaScript.
File	<b>File</b> Hook into native file system through JavaScript.
Geolocation	<b>Geolocation</b> Make your application location aware.
Media	<b>Media</b> Record and play back audio files.
Notification	<b>Notification</b> Visual, audible, and tactile device notifications.
Storage	<b>Storage</b> Hook into the devices native storage options.

# Make your own plugin-1

試想之～

```
<script language="javascript">  
    var SQL="SELECT * FROM `datas`";  
    $("#output").html(dbArray(SQL));  
</script>  
</head>  
<body>  
    <div id="output"></div>  
</body>
```

# Make your own plugin-2

試想之～

```
<script language="javascript">  
    var data_json=getJson('web_service');  
    $("#name").html(data_json[0]['姓名'  ]);  
</script>  
</head>  
<body>  
    姓名: <div id="name"></div>  
</body>
```

# Make your own plugin-3

```
<script language="javascript">
    saveToDb("man_data",$("#datas"));
    upload("http....", "#datas",function(data){
        showProcessBar(data.value);
    },function(err){
        alert(err.message());
    });
</script>
<form id="#datas">
姓名: <div id="name"></div>
電話: <div id="tel"></div>
    <input type="submit" value="送出" >
</form>
```

# Make your own plugin-4

# Make your own plugin-4..

- **Maps to (From) SQLite**
- **Base64 string images**
- **ContentProvider**
- **Sync 、 Async Javascript Plugin**
- **Compass**
- **GPS**
- **File assets 、 sdcard**
- **Http upload 、 download**
- **.....**

# Make your own plugin-HowTo

- 1. 寫 `native java` 接口
- 2. 於 `plugin` 註冊該函式
- 3. 於 `javascript` 登入使用函式

# 自編 plugin: Native Java Plugin

```
public class helloWorld extends Plugin {  
    public PluginResult execute(String action, JSONArray args, String callingbackId) {  
        //PluginResult  
        try{  
            if(action=="helloWorld"){  
                String name = args.getString(0);  
                // sendJavascript("alert('Hello, World!!!');  
                PluginResult result = new PluginResult(PluginResult.Status.OK,"Hello World!!");  
                return result;  
            } catch(Exception e) {  
                return new PluginResult(PluginResult.Status.INVALID_ACTION, "hello missing  
parameter!");  
            }  
        }  
    }  
    public boolean isSynch(String action) {  
        return true;  
    }  
}
```

# 自編 plugin: 於 plugin 註冊該函式

- **res/xml/plugins.xml**
- `<plugin name="helloWorld" value="com.phonegap.plugins.helloWorld.helloWorld"/>`

# 自編 plugin: 於 jscript 註冊該函式

```
window.plugins.helloWorld. helloWorld(value,  
    function(win){  
        data=print_r(win,true);  
    }  
);
```

如此一來，就有自己定的函式可以使用了 ~

```
<script language="javascript">  
    helloWorld();  
</script>
```

# 自編 plugin: 於 jscript 註冊該函式

```
window.plugins.helloWorld. helloWorld(value,  
    Var data="";  
    function(win){  
        data=win,true;  
    }  
    return data;  
);
```

如此一來，就有自己定的函式可以使用了 ~

```
<script language="javascript">  
    helloWorld();  
    alert("test");  
</script>
```

# Supports

使用 Html 、 javascript 、 css 的支援：

有超級多的 framework 如 jQuery 、 phpjs 、 extps... 。

從古至今很多 javascript 特效，且免費的。

可以自定 javascript 的 plugin 與後端 JAVA 、硬體溝通，那等同於你的介面幾乎可以作任何事，如 javascript 開、關新的 activity 、檔案 IO 、資料庫連線、相機呼叫、指南針、GPS 、各種資訊…

且 java 也可以直接 `sendJavascript("alert([json data]);");`  
與 webview 溝通 !!

原本的 webview : `webview.load("javascript:....");`

# Supports

	 iPhone / iPhone 3G	 iPhone 3GS and newer	 Android	 OS 5.x	 OS 6.0+	 WebOS	 WP7	 Symbian	 Bada
ACCELEROMETER									
CAMERA									
COMPASS									
CONTACTS									
FILE									
GEOLOCATION									
MEDIA									
NETWORK									
NOTIFICATION (ALERT)									
NOTIFICATION (SOUND)									
NOTIFICATION (VIBRATION)									
STORAGE									

# 心得

**PhoneGap** 的優勢在於快速成型 **UI** 的調整。

將畫面以 **HTML** 編寫至裝置中，也方便與客戶討論。

速度仍輸 **Native code**，但同時考驗開發者熟悉程度。

**Dreamweaver CS 5.5** 已支援 **phonegap** 的開發了。

滑鼠與觸控事件的關係要非常熟悉，平移、雙指縮放、三指使用，也不成問題。

盡可能將預先載入的內容減少。
